FABRIC COMPENSATORS

9.0 Elastomer, rubber and metal compensators

Elastomer compensators for FGD and FGP plants (see also 3.3.6)

These compensators are used wherever an increased incidence of chemical attack is anticipated. Depending on the elastomer quality, they can be used at up to $200 \,^{\circ}$ C.

They are available for round and square-shaped conduit with or without pre-formed bulge at the edges and upon request with a vulcanised outlet nozzle with or without flange connection.

We produce elastomer compensators using a patented manufacturing technique with and without a pre-formed bulge at the edge area.

Edge without pre-formed bulge

Rubber compensators

With pressure-proof cord inserts for all sectors of industry to compensate expansions and to reduce noise and vibration transmission - also in a braced version.

Metal compensators

For high pressure and temperature loads, also in special steels and all weldable metals; with or without flanges, movement restrainers are supplied on request.

Chimney seals

Lining-joint seals made of fluor rubber terpolymer with wire mesh reinforcement made of high-alloy stainless steel are used to seal the expansion joint in chimney lining.

The sealing strip is attached to the lining by means of wall anchors and clamping strips made of high-alloy stainless steel. The clamping strips and wall anchors can also be coated with fluor rubber. Due to its special construction and the materials selected this seal can be subjected to a sustained temperature load of up to 200 $^{\circ}$ C.

Realon cords made of PTFE with a silicate-fibre core for permanent temperatures up to 260 °C and short-term peak loads up to 305 °C are used in chimneys to additionally safeguard the lining-joint seal.
